

Docker BuildKit TOML Configuration - Word by Word Breakdown

Think of BuildKit as a Construction Company

BuildKit is like a **construction company** that builds Docker images. The `buildkitd.toml` file is like the **company's operations manual** - it tells the construction workers (buildkitd daemon) how to operate, where to store materials, how to handle security, and what rules to follow.

File Location Structure

```
/etc/buildkit/buildkitd.toml    ← Rootful mode (like admin office)
~/.config/buildkit/buildkitd.toml ← Rootless mode (like home office)
```

Real-World Analogy: Like having a company handbook either at corporate headquarters (rootful) or at your home office branch (rootless).

Global Settings Section

Debug and Trace Settings

```
toml

debug = true
trace = true
```

ASCII Visualization:

```
Normal Mode: [BuildKit] → [Build] → [Success]
Debug Mode:  [BuildKit] → [🔍 Debug Info] → [Build] → [📋 Detailed Log] → [Success]
Trace Mode:  [BuildKit] → [🔍🔍 ULTRA Debug] → [Every Step Logged] → [Success]
```

Real-World Analogy:

- **Normal:** Construction supervisor gives basic updates
- **Debug:** Supervisor explains each decision and problem
- **Trace:** Supervisor describes every single nail hammered and screw turned

Root Directory

```
toml
```

```
root = "/var/lib/buildkit"
```

ASCII Visualization:

BuildKit Workspace:

/var/lib/buildkit/

```
├── cache/      ← Material storage
├── metadata/   ← Project blueprints
├── snapshots/  ← Work-in-progress photos
└── tmp/        ← Temporary workspace
```

Real-World Analogy: This is BuildKit's main warehouse where all materials, blueprints, and work-in-progress projects are stored.

Insecure Entitlements

```
toml
```

```
insecure-entitlements = [ "network.host", "security.insecure" ]
```

ASCII Visualization:

```
🔒 Normal Build: [Container] — | Security Gate | — [Host Network]
🚫 Insecure Build: [Container] —————→ [Direct Host Access]
```

Real-World Analogy: Like giving construction workers master keys to the entire building instead of just their work area - powerful but risky.

Logging Configuration

```
toml
```

```
[log]
format = "text"
```

Real-World Analogy: Choosing between a **newspaper format** (text) vs **data spreadsheet format** (json) for your construction daily reports.

DNS Configuration

toml

```
[dns]
nameservers=["1.1.1.1","8.8.8.8"]
options=["edns0"]
searchDomains=["example.com"]
```

ASCII Visualization:

BuildKit needs to find docker.io:

BuildKit → [DNS: 1.1.1.1] → "Where is docker.io?" → [IP: 54.230.75.15] → Download

Real-World Analogy:

- **Nameservers:** Like having multiple phone books (Cloudflare, Google)
- **searchDomains:** If you say "go to 'registry'", automatically try "registry.example.com"
- **options:** Special phone book features (like enhanced directory services)

GRPC Communication Settings

toml

```
[grpc]
address = [ "tcp://0.0.0.0:1234" ]
debugAddress = "0.0.0.0:6060"
uid = 0
gid = 0
```

ASCII Visualization:

Client Commands:

[Docker Build] —tcp://0.0.0.0:1234—→ [BuildKit Daemon]

↓

Debug/Monitoring: [Debug Port 6060]

[Profiler Tools] ←—————

Real-World Analogy:

- **Main address:** Like the main phone number for your construction company
- **debugAddress:** Like a special hotline for supervisors to check on work progress
- **uid/gid:** Like specifying which employee ID has authority to answer calls

TLS Security

```
toml

[grpc.tls]
cert = "/etc/buildkit/tls.crt"
key = "/etc/buildkit/tls.key"
ca = "/etc/buildkit/tlsca.crt"
```

ASCII Visualization:

```
Secure Communication:
[Client] —🔒encrypted—→ [BuildKit]
←🔒encrypted—←
```

Real-World Analogy: Like having encrypted walkie-talkies for construction site communication - only authorized people with the right codes can listen in.

OpenTelemetry (OTEL)

```
toml

[otel]
socketPath = "/run/buildkit/otel-grpc.sock"
```

Real-World Analogy: Like having a dedicated data analyst who sits in a specific office and collects performance metrics about your construction projects.

Container Device Interface (CDI)

```
toml

[cdi]
disabled = true
specDirs = ["/etc/cdi", "/var/run/cdi", "/etc/buildkit/cdi"]
```

ASCII Visualization:

GPU/Special Hardware Access:

[Build Container] —  CDI Disabled —→ [No Special Hardware]

[Build Container] —  CDI Enabled —→ [GPU, FPGAs, Special Devices]

Real-World Analogy: CDI is like a **specialized equipment rental system**. If disabled, workers only get basic tools. If enabled, they can request special equipment like cranes or specialized machinery.

Build History

toml

[history]

maxAge = 172800 # 48 hours in seconds

maxEntries = 50

ASCII Visualization:

Build History Log:

[Build #1] — 47h ago —  Keep

[Build #2] — 49h ago —  Delete (too old)

[Build #50] —  Keep (within limit)

[Build #51] —  Delete (over limit)

Real-World Analogy: Like keeping construction project records for 2 days or up to 50 projects maximum - old paperwork gets shredded automatically.

Worker Configuration - OCI Worker

toml

[worker.oci]

enabled = true

platforms = ["linux/amd64", "linux/arm64"]

snapshotter = "auto"

rootless = false

ASCII Visualization:

Multi-Platform Building:

Real-World Analogy:

- **OCI Worker:** Like having a **specialized construction crew**
- **platforms:** Crew can build both **skyscrapers** (amd64) and **tiny houses** (arm64)
- **snapshotter:** Method for taking **progress photos** (overlayfs = layered photos, native = simple snapshots)
- **rootless:** Whether crew needs **manager permissions** or can work independently

Process Sandbox

toml

`noProcessSandbox = false`

ASCII Visualization:

With Sandbox: [Build Process] — | Isolation Wall | — [Host System]

Without Sandbox: [Build Process] —————→ [Direct Host Access]

Real-World Analogy: Like deciding whether construction workers work in a **fenced construction site** (sandbox) or have **free access to the entire property**.

Garbage Collection Settings

toml

`gc = true`

`reservedSpace = "30%"`

`maxUsedSpace = "60%"`

`minFreeSpace = "20GB"`

ASCII Visualization:

Disk Space Management (100GB total disk):

The diagram illustrates the disk space management for a 100GB total disk. It is divided into three sections:

- Reserved (30GB)**: Indicated by a red bar and the text "← Never touch this".
- Working (30GB)**: Indicated by a blue bar and the text "← BuildKit can use this".
- Free (40GB)**: Indicated by a green bar and the text "← Must keep at least 20GB free".

Disk Space Management (100GB total disk):

The diagram illustrates the disk space management for a 100GB total disk. It is divided into three sections:

- Reserved (30GB)**: Indicated by a red bar and the text "← Never touch this".
- Working (30GB)**: Indicated by a blue bar and the text "← BuildKit can use this".
- Free (40GB)**: Indicated by a green bar and the text "← Must keep at least 20GB free".

Real-World Analogy:

- **reservedSpace:** Like keeping 30% of warehouse space always empty for emergencies
- **maxUsedSpace:** Never use more than 60% of total storage
- **minFreeSpace:** Always keep at least 20GB free, like keeping loading dock space clear

- ### Real-World Analogy:
- **reservedSpace:** Like keeping 30% of warehouse space always empty for emergencies
 - **maxUsedSpace:** Never use more than 60% of total storage
 - **minFreeSpace:** Always keep at least 20GB free, like keeping loading dock space clear

Performance Settings

```
toml

max-parallelism = 4
cniPoolSize = 16
```

Performance Settings

```
toml

max-parallelism = 4
cniPoolSize = 16
```

Performance Settings

Project 1: [Worker A] —building—→

Project 2: [Worker B] —building—→

Project 3: [Worker C] —building—→

Project 4: [Worker D] —building—→

Project 5: [Waiting...] (max-parallelism = 4)

Network Pool:

[Net1][Net2][Net3]...[Net16] ← Pre-made network connections

ASCII Visualization:

Parallel Work:

Project 1: [Worker A] —building—→

Project 2: [Worker B] —building—→

Project 3: [Worker C] —building—→

Project 4: [Worker D] —building—→

Project 5: [Waiting...] (max-parallelism = 4)

Network Pool:

[Net1][Net2][Net3]...[Net16] ← Pre-made network connections

ASCII Visualization:

Parallel Work:

Project 1: [Worker A] —building—→

Project 2: [Worker B] —building—→

Project 3: [Worker C] —building—→

Project 4: [Worker D] —building—→

Project 5: [Waiting...] (max-parallelism = 4)

Network Pool:

[Net1][Net2][Net3]...[Net16] ← Pre-made network connections

Real-World Analogy:

- **max-parallelism**: Maximum number of **construction crews working simultaneously**
- **cniPoolSize**: Like having **16 pre-setup work sites** so crews don't waste time setting up/tearing down each time

- ### Real-World Analogy:
- **max-parallelism**: Maximum number of **construction crews working simultaneously**
 - **cniPoolSize**: Like having **16 pre-setup work sites** so crews don't waste time setting up/tearing down each time

Container Runtime

Container Runtime

```
binary = ""  
apparmor-profile = ""
```

Real-World Analogy:

- **binary:** Like choosing which **type of construction equipment** to use (bulldozer vs excavator)
- **apparmor-profile:** Like assigning **specific safety protocols** that workers must follow

Worker Labels and GC Policies

toml

```
[worker.oci.labels]  
"foo" = "bar"  
  
[[worker.oci.gcpolicy]]  
reservedSpace = "512MB"  
maxUsedSpace = "1GB"  
minFreeSpace = "10GB"  
keepDuration = "48h"  
filters = [ "type==source.local", "type==exec.cachemount", "type==source.git.checkout"]
```

ASCII Visualization:

Garbage Collection Rules:

Rule 1: Local files — keep 48h — then delete if space needed

Rule 2: Cache mounts — keep 48h — then delete if space needed

Rule 3: Git checkouts — keep 48h — then delete if space needed

Space Management:

[512MB Protected] [488MB Working] [Rest Must Stay Free]

Real-World Analogy:

- **Labels:** Like putting **name tags** on different work crews
- **GC Policies:** Like having **different cleanup rules** - keep blueprints for 48 hours, but throw away construction debris immediately

toml

```
[worker.containerd]
address = "/run/containerd/containerd.sock"
enabled = true
namespace = "buildkit"
defaultCgroupParent = "buildkit"
```

ASCII Visualization:

BuildKit \leftrightarrow Containerd Connection:
[BuildKit] —unix socket— \rightarrow [/run/containerd/containerd.sock] \leftarrow [Containerd]

Real-World Analogy:

- **Containerd worker:** Like having a **different construction company** (containerd) as a subcontractor
- **namespace:** Like working in a **specific section** of a larger construction site
- **defaultCgroupParent:** Like having all projects report to the **same project manager**

Registry Configuration

toml

```
[registry."docker.io"]
mirrors = ["yourmirror.local:5000", "core.harbor.domain/proxy.docker.io"]
http = true
insecure = true
ca = ["/etc/config/myca.pem"]
```

ASCII Visualization:

Registry Mirror System:
Need ubuntu image:
[BuildKit] \rightarrow [Mirror 1: yourmirror.local:5000] — if available — \rightarrow [Image]
 \downarrow if not available
 \rightarrow [Mirror 2: core.harbor.domain] — if available — \rightarrow [Image]
 \downarrow if not available
 \rightarrow [docker.io] ————— \rightarrow [Image]

Real-World Analogy:

- **Registry:** Like **hardware stores** where you buy construction materials
 - **Mirrors:** Like having **local suppliers** who stock the same items as the main store
 - **http/insecure:** Like choosing between **secure courier delivery** vs **regular mail**
-

Frontend Control

```
toml

[frontend."dockerfile.v0"]
enabled = true

[frontend."gateway.v0"]
enabled = true
allowedRepositories = []
```

ASCII Visualization:

```
Build Frontend Types:
[Dockefile] —dockerfile.v0—> [BuildKit] —> [Image]
[Custom Script] —gateway.v0—> [BuildKit] —> [Image]
```

Real-World Analogy:

- **Frontends:** Like different **types of blueprint formats** your construction company accepts
 - **dockerfile.v0:** Standard architectural blueprints
 - **gateway.v0:** Custom engineering plans (with security restrictions on who can submit them)
-

System Settings

```
toml

[system]
platformsCacheMaxAge = "1h"
```

Real-World Analogy: Like **refreshing your catalog** of available construction equipment types every hour - checking if new machinery models are available or if old ones are discontinued.

Key Takeaways

BuildKit TOML Configuration is like...

1.  **Operations Manual:** Tells the construction company how to work
2.  **Office Setup:** Where to store files, how to communicate
3.  **Crew Management:** How many workers, what tools they use
4.  **Cleanup Rules:** When to throw away old materials
5.  **Supplier Relationships:** Where to buy materials, security protocols
6.  **Blueprint Standards:** What types of plans are accepted

The configuration balances **performance** (parallel work), **security** (isolation, certificates), **storage management** (garbage collection), and **flexibility** (multiple workers, registries) to create an efficient Docker image building system.
